Troubleshooting Anduril Services

Anduril is finally set up to boot directly to a fully functional FileMaker and Web FileMaker server.

So, if it ever croaks, just reboot it and go hide, and everything should be okay (i.e. Prospero, FileMaker and Web FileMaker should be up and running).

It does this as follows, in case you need to troubleshoot it:

1. Autologon of ANDURIL\Administrator at system startup.
2. Batch file in Startup folder of Administrator's Start Menu that starts FMSERVER and loads **startweb.fp5**
3. FileMaker script in **startweb.fp5** that loads all the web-hosted databasees.

Oh yeah, if it does go down, please tell ILL about it (they probably just think of it as "Prospero") and of course, your esteemed colleagues who will be desparately trying to use the SR database.
